and
National Agricultural Statistics Service**

ACKNOWLEDGMENT

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida as shown in this summary are official estimates of the Florida Agricultural Statistics Service. Corresponding data for other citrus states are from official reports of the USDA, National Agricultural Statistics Service. Canned and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services, were used in preparing production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, processors, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

This report was assembled under the direction of Robert R. Terry, Candice T. Erick, and Elise Leiphart of the Florida Agricultural Statistics Service.

FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS AND MONTHS, 1990-91 CROP YEAR

The 1990-91 season weather was mostly favorable for citrus development. Following the December 1989 freeze, trees in many areas defoliated but because of the abundant moisture before the freeze, very little wood damage was experienced south of Polk County. Very warm weather in January and February caused trees to flush with new growth and bloom. The bloom statewide on undamaged trees was the heaviest in many seasons.

Temperatures continued warm through the remainder of the winter with rainfall in adequate amounts and a very heavy fruit set resulted. Development of fruit was normal but with the heavy fruit set, sizes remained small.

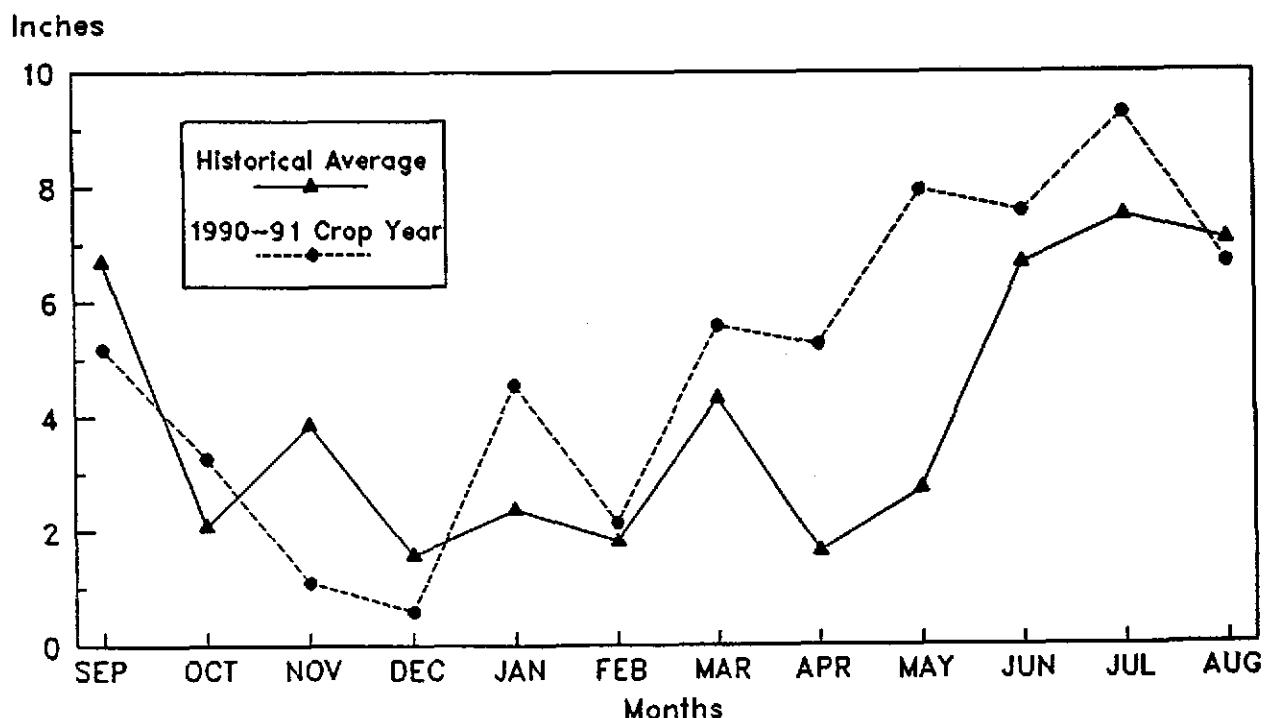

Spring 1990 rains, although spotty, were sufficient for normal fruit development. Temperatures continued above normal levels into the summer months.

Summer rainfall became spotty and by September some areas were up to 10 inches deficient for the year. Irrigation was used extensively to relieve shortages. Due to the early bloom period maturity levels were well advanced and grapefruit picking began in early August. This was the earliest harvest on record.

Rainfall continued spotty and light until January and some locations in south Florida did not have temperatures below 40 degrees all winter. Harvest progressed rapidly as maturity levels for all varieties were four to six weeks advanced.

As shown in the chart below, rainfall was abundant during the spring months with temperatures in most locations generally above normal levels. Harvest continued ahead of normal because of the advanced maturity and was concluded earlier than normal.

1990-91 PRODUCTION AND TREE CENSUS

PRODUCTION

Florida's citrus production rebounded from the 1989-90 season. Production of oranges at 151.5 million boxes was up 37 percent from the previous season's 110.2 million boxes. An abundant bloom and excellent weather helped produce the largest crop since 1980-81.

Grapefruit production was up also at 45.1 million boxes. White seedless varieties produced 21.7 million boxes and colored varieties 21.8 million boxes.

Temple production was up substantially from the 1989-90 freeze season. Tangerine production was up also but all other varieties saw decreases in production.

The all orange FCOJ final yield was 1.45383 gallons per box, up from the freeze reduced yield of 1.22604 the previous season. Early and midseason oranges averaged 1.39285 gallons per box and Valencias 1.55915.

California's production was greatly reduced by a major freeze especially in the San Joaquin Valley area. Orange production at 26.8 million boxes was the lowest in many years. Grapefruit production at 8.0 million boxes was slightly less than the previous year.

Arizona's citrus was not affected by the freeze. Orange production was 1.75 million boxes and grapefruit 2.4 million boxes.

Because of the Christmas 1989 freeze, Texas produced no commercial amounts of citrus in the 1990-91 season. Many trees were killed and others were heavily damaged.

TX	85	80	--	--	--
AZ	75	64	75	76	--

1/ Includes Temples and tangelos at 90 lbs.

TREE CENSUS

The Florida Agricultural Statistics Service first indexed the State's commercial citrus groves on aerial photography as of January 1966. Ground crews identify all the State's groves by fruit type, row spacing, and year in which set. Photo interpreters in the Orlando office then delineate the groves by variety blocks on photo transparencies at a scale of 1 inch to 660 feet. Variety blocks are measured with planimeters to obtain acreage and then indexed by land section.

The design of the inventory allows for quick and economical updating. Since 1966, the citrus belt has been resurveyed each second winter (1968 through 1990) to determine changes. Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three-mile-wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography are obtained at a 1 to 30,000 scale.

The last statewide survey was conducted as of January 1990. Through 1989, all types of citrus planted totaled 732,767 acres, up 5 percent from the 697,929 acres recorded in January 1988. Increases were highest in lower interior counties. Acreage by counties and types is shown on page 27.

Photography for the current survey began in November 1991 and field work will update the acreage records as of January 1992.

FLORIDA, ALL CITRUS: Acres in commercial groves as of January 1966-1990, with percent changes

Year	Acres	Percent change from

1988	697,929	+11.8	-18.7
1990	732,767	+ 5.0	-14.6

1990-91 VALUE OF SALES, PRICES, AND EXPORTS

VALUE

The preliminary on-tree value of all citrus for the 1990-91 season is \$1.318 billion. This is 38 percent more than the 1989-90 revised value of \$952 million. The record high 1987-88 season value was \$1.443 billion.

Preliminary value is based on that part of the crop priced at harvest, about 60 percent of the total. When all participation plans and cooperative pools are finalized, a revised value is calculated. The slight upward revision in the 1989-90 season was due to the participation prices that were higher than cash prices for oranges.

Preliminary orange prices are up from a revised \$6.21 in 1989-90 to \$6.50 in 1990-91. Fresh shipments were up substantially but prices were lower at \$8.96 per box compared to \$10.31 in 1989-90. Processing prices are up from \$5.98 to \$6.29.

Grapefruit prices are down slightly from \$5.65 to \$5.43. Prices for fresh grapefruit returned \$8.79 per box and processing returned \$1.63. Prices for tangerines, Temples, tangelos, and limes are up but K-Early citrus fruit and lemon prices are down.

The season average delivered-in price of fruit going into FCOJ as reported by the Florida Citrus Processors Association is \$8.23 per box or \$1.40 per pound of solids. Early-mids averaged \$7.83 per box or \$1.41 per pound and Valencias averaged \$8.86 per box or \$1.40 per pound solids.

FLORIDA, ALL CITRUS: Value of sales on-tree, crop years 1981-82 through 1990-91

Crop year	Value 1,000 dol.	Crop year	Value 1,000 dol.

1982-83	876,777	1987-88	1,443,808
1983-84	849,457	1988-89	1,429,808
1984-85	984,820	1989-90 ¹	952,303
1985-86	725,035	1990-91 ²	1,318,369

1/ Revised. 2/ Preliminary.

FOREIGN EXPORTS

Fresh fruit exports totaled 25,641,000 4/5 bushel cartons. Beginning with the 1989-90 season, shipments to Canada and Mexico have been included in export totals. Canada accounts for the most receipts of Florida oranges and tangerines and Japan is the largest recipient of grapefruit.

A total of 6.2 million gallons of FCOJ were exported, mostly to Canada. There were also 3.0 million gallons of FCGJ exported, down slightly from 3.4 million gallons the previous season.

PRICES

All on-tree prices represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit sales and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Each season, beginning with the first month that three percent of a fruit type is harvested, monthly estimates are computed. Reports from fresh fruit sales organizations and from packers provide data for an average f.o.b. price. Processors report an average spot and cash price for fruit delivered to their plants. From these values, an estimated charge for picking, hauling, and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales. At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, cooperatives and firms with participation plans report prices of fruit they handled. These prices, combined with the spot and cash prices collected earlier, are weighted together by varieties to determine the final processing price received by growers. From this price, charges for picking, hauling, and packing, as estimated by University of Florida economists, are deducted to arrive at the final on-tree price received by growers.

COUNTY PRODUCTION

Estimates of citrus production by counties were prepared using objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for droppage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Productivity per tree is obtained from several objective fruit surveys including limb count, size, and dropage. Because of the statistical sampling design, counties with higher production in general have a greater number of samples and, therefore, estimates for these counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are more reliable than for individual counties.

FLORIDA CITRUS: Production of all citrus since 1886-87

HISTORY OF FLORIDA'S CITRUS INDUSTRY

The citrus tree is a native of the Orient. From there it was carried ever westward by man, to India, to the Mediterranean, and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were grown in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. One of the oldest cultivated groves planted in Florida (Hume, 1926 p.95) is thought to have been the Don Phillippe grove in Pinellas County, planted sometime between 1809 and 1820.

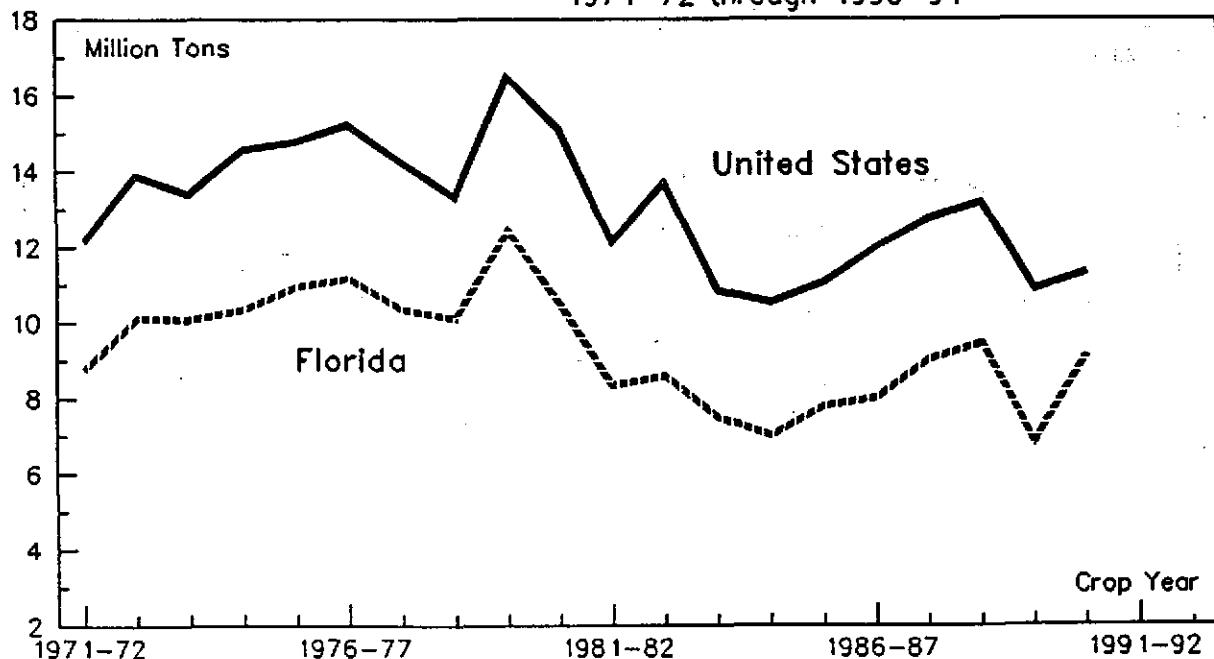

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. In 1990-91, Florida had 81 percent of the Nation's production.

SOURCE: See Page 45, Data Sources, Item 5.

Footnote 3/ for page 32, 2/ for page 33, and 1/ for page 34. Final Mexican shipments to the U.S. are reported by FAS as a combined total for oranges and tangerines. The totals shown on pages 32 through 34 have been broken down proportionally into oranges and tangerines from Plant Quarantine data reported at the time of the crossing. Plant Quarantine releases give separate totals for these two types of citrus. Mexican shipments through the U.S. to Canada are not included.

1/ Forecast. 2/ One metric ton is equivalent to 2,204.6 pounds. 3/ Includes tangerines and Temples in some countries.

4/ Includes some fruit produced in Swaziland, Botswana, and Mozambique which is marketed through the South African Citrus board. 5/ Mainly satsumas but also including mandarin hybrids. 6/ State of Sao Paulo only, which apparently accounts for over one-half of Brazil's production. About 120,000 tons of tangerines which are processed are included in the orange table. 7/ Clementines only. 8/Includes tangelos, which account for about half of the total production.
